

DANS AND GUYS AMAZING TRANSPORT SYSTEM!

Rules of use:

1) To work you must have a Document. Create a new one using the “1” function. The command will return your document ID, which will be used in many functions.

2) Every time you wish to alter the document you need to use your document ID.

3) In the main menu there are many functions, in 4 main categories.

- a) Display function – return list of all the available ‘X’ (stores, products, etc...)
- b) Add functions – these functions add items to your document
- c) Edit function – after you finished your Transport Document you may change anything you wish, the change will be recorded and stored.
- d) Print function – these are functions which print out the document you have.

4) C and D functions have their own menu, for easier readability.

5) We followed our scenario from Part 1 in which there is an order to adding items:

- a) Add store
- b) Add products
- c) Add supplier
- d) Add trucks
- e) Add driver
- f) Additional items may be added as you please

Not following this order may results in errors!!!

5) each function will ask you to enter different variables based on its needs. You may need to use the display function for these details.

6) **each variable will be entered separately!!!**

7) we have added Document ID: ‘0’ which is already a full document. The project also loads several Stores, Products, Suppliers, Drivers and Trucks for your use.

Enjoy,

Dan and Guy
